

# ECE 417/598: Homework 2

Max marks: 90 marks. ETA: 90 min

Due on Feb 7th, 2021, midnight, 11:59 PM.

You can also use the following template to fill in your answers: hw2.cpp

**Problem 2** Write a pair of functions in C++ that converts rotation matrix from axis-angle representation and vice versa. Recall that

## 1 Jan 26 Lecture

**Problem 1** In class we proved the Rodrigues formula that converts from axis-angle representation  $(\theta, \hat{\mathbf{k}})$ , where  $\theta$  is the angle of rotation and  $\hat{\mathbf{k}}$  is the axis of rotation ( $\|\hat{\mathbf{k}}\| = 1$ ). Let  $\mathbf{K} = [\hat{\mathbf{k}}]_{\times}$  be the cross product matrix of  $\hat{\mathbf{k}}$ . The cross product matrix of  $\hat{\mathbf{k}} = [k_x, k_y, k_z]^T$  (such that  $k_x^2 + k_y^2 + k_z^2 = 1$ ) is defined as,

$$\mathbf{K} = [\hat{\mathbf{k}}]_{\times} = \begin{bmatrix} 0 & -k_z & k_y \\ k_z & 0 & -k_x \\ -k_y & k_x & 0 \end{bmatrix} \quad (1)$$

The corresponding rotation matrix is given by,

$$R(\theta, \hat{\mathbf{k}}) = \mathbf{I} + \sin \theta \mathbf{K} + (1 - \cos \theta) \mathbf{K}^2. \quad (2)$$

An exponential of a square matrix  $\mathbf{M}$  is defined as

$$\exp(\mathbf{M}) = \sum_{n=0}^{\infty} \frac{1}{n!} \mathbf{M}^n = \mathbf{I} + \frac{1}{1!} \mathbf{M} + \frac{1}{2!} \mathbf{M}^2 + \dots \quad (3)$$

Recall the series expansion of  $\sin \theta$ , and  $\cos \theta$ ,

$$\sin \theta = \theta - \frac{\theta^3}{3!} + \frac{\theta^5}{5!} - \dots \quad (4)$$

$$\cos \theta = 1 - \frac{\theta^2}{2!} + \frac{\theta^4}{4!} - \dots \quad (5)$$

1. First prove that  $\mathbf{K}^3 = -\mathbf{K}$ . (15 marks, 15 minutes)
2. As a result note that  $\mathbf{K}^4 = -\mathbf{K}^2$ ,  $\mathbf{K}^5 = \mathbf{K}$ , and so on. In general,  $\mathbf{K}^{2n+1} = (-1)^n \mathbf{K}$  and  $\mathbf{K}^{2n+2} = (-1)^n \mathbf{K}^2$ . Using the expansion of  $\sin \theta$  and  $\cos \theta$ , prove that  $R(\theta, \hat{\mathbf{k}}) = \exp(\theta \mathbf{K})$ . (30 marks, 30 minutes)

$$R(\theta, \hat{\mathbf{k}}) = \mathbf{I} + \sin \theta \mathbf{K} + (1 - \cos \theta) \mathbf{K}^2. \quad (6)$$

and to get axis-angle back from a given rotation matrix

$$R = \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix}, \quad (7)$$

we have

$$\theta = \cos^{-1} \left( \frac{\text{tr}(R) - 1}{2} \right) \quad (8)$$

$$\hat{\mathbf{k}} = \frac{1}{2 \sin \theta} \begin{bmatrix} r_{32} - r_{23} \\ r_{13} - r_{31} \\ r_{21} - r_{12} \end{bmatrix} \text{ if } \theta \neq 0 \text{ or } \pi. \quad (9)$$

If  $\theta = 0$  or  $\pi$ , then

$$\hat{\mathbf{k}} = \pm \begin{bmatrix} \sqrt{(r_{11} + 1)/2} \\ \sqrt{(r_{22} + 1)/2} \\ \sqrt{(r_{33} + 1)/2} \end{bmatrix} \quad (10)$$

(30 marks. Estimated time: 30 min)

## 2 Jan 31 Lecture

**Problem 3** Recall the definition of Denavit-Hartenberg parameters from the video. Recall that transformation between two joints for the defined parameters  $d, \theta, r, \alpha$  is given by,

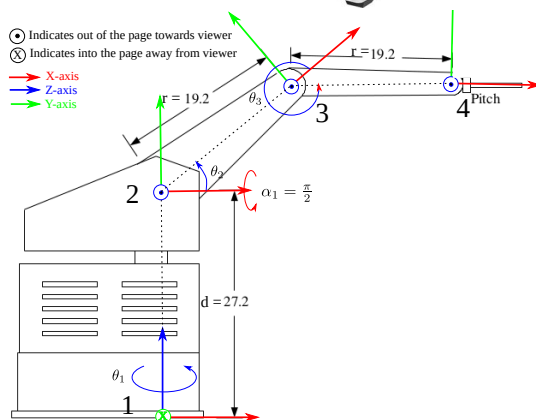

$$T = T_z(\theta, d) T_x(\alpha, r), \quad (11)$$

where

$$T_x(\alpha, r) = \begin{bmatrix} 1 & 0 & 0 & r \\ 0 & \cos(\alpha) & -\sin(\alpha) & 0 \\ 0 & \sin(\alpha) & \cos(\alpha) & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad (12)$$

$$T_z(\theta, d) = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 & 0 \\ \sin(\theta) & \cos(\theta) & 0 & 0 \\ 0 & 0 & 1 & d \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad (13)$$

For the robot given below find transformation matrix from joint 4 to joint 1 assuming the joint angles to be  $\theta_1, \theta_2, \theta_3$  respectively. Write the expression for  ${}^3T_4(\theta_3), {}^2T_3(\theta_2), {}^1T_2(\theta_1)$  and then  ${}^1T_4(\theta_1, \theta_2, \theta_3)$  in terms of the first three transformations. You do not need to expand the expression of  ${}^1T_4(\theta_1, \theta_2, \theta_3)$ .

(15 marks. 15 min)

### 3 ECE 598 only

Write a short review of the following paper On continuity of rotation representations in Neural networks. We have not covered all the concepts covered in this paper; you can skip the parts that you do not understand. In the review answer the following questions evaluating the paper,

1. Problem: What problem is the paper trying to solve?
2. Approach: What is the proposed approach to solve the problem?
3. Contribution: What is the paper's novel contribution?
4. Evidence: Do they any experiments or proof that their approach/contributions work?
5. Results: Are the results of the paper justified by evidence and a direct result of the contributions?

(Ungraded. 3-5 hrs)
